Introduction to OpenCV

OpenCV (Open Source Computer Vision Library) is an open source computer vision and machine learning software library. OpenCV libraries are used to communicate with cameras. APIs introduced in the OpenCV can be supported with all e-con Systems cameras.

This document provides the details about the APIs introduced in the OpenCV Video Capture class.

Description

The APIs introduced in the OpenCV can be used to communicate with the cameras. Human Interface Device(HID) related APIs were implemented in the OpenCV, which will be useful to access HID device information of the camera. The APIs introduced were solely related to communicate with camera properties and HID settings of the camera.

Introduced APIs

The details regarding the APIs introduced in OpenCV are covered in this section.

BOOL getDevices(int &devices)

This function retrieves the number of camera devices connected to the PC.

Parameters	Description	Return Values
int		TRUE on Success
&devices	Number of camera devices connected to	FALSE on Failure
WAC VICED	the port is retrieved.	Number of Devices
	·	Connected

Sample Code

```
VideoCapture cap;
if(cap.getDevices(devices))
{
    cout << "The number of camera devices connected to
the port is " << devices << '\n';
}</pre>
```

BOOL getDeviceInfo(int index, String &deviceName, String &vid, String &pid, String &devicePath)

This function will retrieve the Name, Vendor ID, Product ID and Path of the camera device connected to the port. Before calling this API, you must know the index of the camera device connected to the port.

Parameters	Description	Return Values
int index	You must input the camera device index.	_
String &deviceName	Retrieves the Name of the camera device.	
String &vid	Retrieves the Vendor ID of the camera device.	TRUE on Success FALSE on Failure
String &pid	Retrieves the Product ID of the camera device.	
String &devicePath	Retrieves the Path of the camera device.	

```
VideoCapture cap;
```

```
if(cap.getDevices(devices))
{
    for(int i = 0; i < devices; i++)
    {
        if(cap.getDeviceInfo(i, deviceName, vid, pid,
        devicePath))
        {
            cout << "Camera Device Name = " <<
            deviceName << endl;
            cout << "Vendor ID = " << vid << endl;
            cout << "Product ID = " << pid << endl;
            cout << "Camera Device Path = " <<
            devicePath << endl;
            }
        }
}</pre>
```

BOOL getFormats(int &formats)

This function is used to get the total number of Video formats supported by the camera with respect to frames per second (fps). Before calling this API, the camera must be opened.

Parameters	Description	Return Values
int &formats	Retrieves the number of formats supported by the camera with respect to fps.	TRUE on Success FALSE on Failure Number of Video formats supported.

```
VideoCapture cap;
cap.open(0);
if(cap.getFormats(formats))
{
    cout << "The total number of formats supported by
the Camera = " << formats << endl;
}</pre>
```

BOOL getFormatType(int formats, String &formatType, int &width, int &height, int &fps)

This function is used to get the Format type, width, height and fps of the camera device connected with respect to the index passed. Before calling this API, you must open the camera and pass the input parameter index to this API.

Parameters	Description	Return Values
int formats	Integer value to be passed as index to the API.	
String &formatType	Retrieves the Format type of the camera with respect to the index passed.	
int &width	Retrieves the width of the resolution with respect to the index passed.	TRUE on Success FALSE on Failure
int &height	Retrieves the height of the resolution with respect to the index passed.	
int &fps	Retrieves the fps with respect to the index passed.	•

Windows Sample Code

The even index is passed in the getFormatType API, since there are two Video Formats of the same type and resolutions will be distinguished as VIDEOINFOHEADER and VIDEOINFOHEADER2. So, you must use VIDEOINFOHEADER that is, even index.

```
}
}
```

Linux Sample Code

BOOL setFormatType(int index)

This function is used to set the Format type, width, height and fps to the camera. Before calling this API, the camera must be open.

Parameters	Description	Return Values
int index	Index to be passed as the input to set the	TRUE on Success
IIIC IIIGCA	Video Format.	FALSE on Failure

```
cout << "Video Format = "<< formatType <<
endl;

cout << "Width = " << width << endl;

cout << "Height = "<< height << endl;

cout << "FPS = " << fps;

}

cin >> index;

if(cap.setFormatType(index))

{
    cout << "Video Format Type is set" << endl;
}</pre>
```

BOOL get(int propId, long &min, long &max, long &steppingDelta, long &supportedMode, long ¤tValue, long ¤tMode, long &defaultValue)

This function is used to retrieve the Minimum, Maximum, Stepping Delta, Supported Mode, Current Value, Current Mode and Default Value of the Camera Video Properties. Before calling this API, the camera must be opened and you must know the property ID of the OpenCV Camera Properties (For example, CV_CAP_PROP_BRIGHTNESS for brightness, CV_CAP_PROP_CONTRAST for contrast and so on).

Parameters	Description	Return Values
int propId	Input the property ID of the camera properties to the API.	
long &min	Retrieves the Minimum value of the camera property supported.	
long &max	Retrieves the Maximum value of the camera property supported.	
long &steppingDelta	Retrieves the Stepping Delta of the camera property supported.	TRUE on Success
long &supportedMode	Retrieves the supported Mode of the camera property (1-Auto, 2-Manual, 3-Auto and Manual).	FALSE on Failure
long ¤tValue	Retrieves the current value set in the camera property.	
long ¤tMode	Retrieves the current Mode set in the Camera.	

Long &defaultValue

Default value of the camera is retrieved for the camera property.

Sample Code

```
VideoCapture cap;
cap.open(0);
if(get(CV_CAP_PROP_BRIGHTNESS, min, max, steppingDelta, supportedMode, currentValue, currentMode, defaultValue))
{
    cout << "Brightness Values: " << endl;
    cout << " Minimum Value = " << min << endl;
    cout << " Maximum Value = " << max << endl;
    cout << "Stepping Delta = " << steppingDelta << endl;
    cout << "Supported Mode = " << supportedMode << endl;
    cout << "Current Value = " << currentValue << endl;
    cout << "Current Mode = " << currentMode << endl;
    cout << "Default Value = " << defaultValue << endl;</pre>
```

BOOL set(int propld, long value, long mode)

This function is used to set the value and mode to the camera property which is passed as input parameter to the API. Before calling this function, the camera must be opened and you must know to which property the value is passed.

- 1 Auto mode.
- 2 Manual mode.
- 3 Auto and Manual mode.

Parameters	Description	Return Values
int propId	You must input the property ID of the camera	
Ine propra	properties to the API.	_
long value	The value to be set in the camera property is	
	passed in this parameter.	_
long mode	This parameter is used to change the mode of	TRUE on Success
Tong mode	the camera property.	FALSE on Failure
	(If the camera supports only auto mode, you	
	cannot set the different value or mode and if	
	the camera supports only manual mode, you	
	cannot set the auto mode).	

```
VideoCapture cap;
cap.open(0);
if(cap.set(CV_CAP_PROP_BRIGHTNESS, 12, 2))
{
     cout << "Camera Brightness value is set" << endl;
}</pre>
```

Support

Contact Us

If you need any support on OpenCV sample application, please contact us using the Live Chat option available on our website - https://www.e-consystems.com/

Creating a Ticket

If you need to create a ticket for any type of issue, please visit the ticketing page on our website - https://www.e-consystems.com/create-ticket.asp

RMA

To know about our Return Material Authorization (RMA) policy, please visit the RMA Policy page on our website - https://www.e-consystems.com/RMA-Policy.asp

General Product Warranty Terms

To know about our General Product Warranty Terms, please visit the General Warranty Terms page on our website - https://www.e-consystems.com/warranty.asp
